IMPROVEMENTS

SALES ORDER

NS-1359: Allowed Customer Address Attribute values to be up to 100 characters

Previously, Customer Addresses Attribute values were limited to 25 characters. This limitation was improved so that these values can be up to 100 characters.

BUG FIXES

INVENTORY

NS-1373: Fixed the defaulting of Site Line and Shift on Production Transaction line items

Previously, a bug existed that caused the Default Line and Default Shift on a Production transaction to not default to the line items' 'Line' and 'Shift' fields correctly. This bug was fixed so that the Line and Shift values will default to all lines from the header values and will save correctly.

SYSTEM

NS-1358: Fixed system security issues with the Fiscal Year and Catalog Items pages

The Fiscal Year record view and Catalog Items pages were incorrectly inserted with the same SK values, causing the system and security settings not to work for these pages. This bug was fixed so that the Catalog Items page and Fiscal Year record view both open correctly, can be assigned security settings appropriately, and ship with the correct System Views.

NS-1360: Fixed security issues with price list mass update

Previously, the Price List mass update form and its controls were incorrectly excluded from the install script. This form and its controls were included so that the page opens correctly and can be assigned security rights appropriately.
