## New Features

### INVENTORY

#### NS-1448: Created the Country of Origin master file

The Country of Origin master file was created in the Inventory module for users to activate or inactivate countries.

## Improvements

### COMPANY

#### NS-1449: Changed the Attribute Classes list view to group by Attribute Class Type

Previously, all Attribute Classes in the Attribute Classes list view were listed alphabetically in order of Attribute Type then Attribute Class. This logic was updated so that all Attribute Classes are displayed under group headings that distinguish one attribute class type's attribute classes from another so that all Customer Address Attribute Classes display alphabetically under the Customer Address Attribute Class group heading, all Customer Attribute Classes display alphabetically under the Customer Attribute Class group heading, etc.

### INTEGRATION

#### NS-1445: Updated stored procedures to trim all ID fields integrated from the host system

All stored procedures that load records from the host system containing ID values were updated to trim the ID values in order to remove unnecessary spaces at the end of the ID in order to prevent any issues.

## INVENTORY

### **NS-1450: Updated the Warehouse Lot Tracked property on the Site record view**

Previously, the Warehouse Lot Tracked property on the Site record view only had the options Yes and No. This logic was updated so that the options include Yes – Multiple Items, Yes – Single Item, and No. If the Site is set to a Warehouse Lot Tracked value of Yes – Single Item, any warehouse lots created for that site are restricted to a single item whereas if the Site is set to a Warehouse Lot Tracked value of Yes – Multiple Items, any warehouse lots created at that site can contain multiple different items.

### **NS-1451: Added the Item: Description field to the Warehouse Lots list view**

The Item: Description field was added to the Warehouse Lots list view in order to determine the item(s) that can be part of the corresponding Warehouse Lot. The Item: Description field is a multi-select drop-down menu that includes all active items for users to select a single item, multiple items, or all items to determine the items that can be added to that warehouse lot.

## Bug Fixes

## INVENTORY

### **NS-1452: Fixed the bug causing the Item History, Lot History, and Product Balances inquiries to fail**

Previously, the implementation of items missing required attributes displaying in red at the top of the Items list view caused the Item History, Lot History, and Product Balances inquiries to fail when the user tried to run them. This bug was fixed so that these inquiries open without issue.
